

Presentation Guidelines – Applied Causal Inference Project

Each group is expected to present the results of their applied causal inference project.

****Length:**** 20 min (**strictly keep that time**) + 10 min questions

The presentation should include the following components:

1. Title and Group Members

2. Motivation and Research Question

3. Data Description

- Source of data
- Dimensions of data (sample size, number of variables, ...)
- Missing values?

4. Causal Assumptions

- Discuss their plausibility for your problem setting
- If appropriate, show empirical validation (e.g., scatter plots or preprocessing steps to discuss linearity); for other assumptions, such as causal sufficiency, discuss based on domain knowledge

5. Methodological Approach

- Briefly introduce the method
- List all parameters used (reproducibility!)

6. Toy Model Experiments (optional, bonus!)

- Discuss ground truth
- Show that the method works and how many samples you need to get reliable results

7. Discussion and interpretation of real data results

- Show your results (graphs, effects, domain knowledge, ...)
- Interpret what we see, best combined with literature from your dataset's application field
- Include uncertainty estimation, if possible; e.g., via bootstrap (bonus!)
- Discuss the limitations of the methodology

8. Summary and outlook

- 3 bullet summary
- 3 bullet points on what you would do if you had more time

9. References

- You don't have to cite literature for the contents of the introductory lecture (PC, FCI, LPCMCI, etc., only additional papers you include, e.g., for validation of your results or domain knowledge
- Use either footnotes or references to a bibliography at the end, but be consistent
